RETURN TO SENDER
2 New Hardy Peaches
Alpha & Omega
FEB 5 1917

TRADE MARK

In size and color resembles the Champion, but of better flavor. The Alpha is the earliest free-stone yet introduced; ripening 35 days earlier than the Elberta. The Omega is in every respect like the Alpha except that it ripens 3 weeks later than the Alpha. These are the most hardy peaches yet introduced having produced a full crop of fruit when every fruit-bud of the Crawford and Elberta (in the same orchard) were killed by the winter frost. The fall is the best time to trans-plant trees in this locality, as they make a much better growth the first year, than spring planted trees. I have a limited number of fine trees to sell, and they are the cheapest trees to plant by all means. I offer them at the following prices.

First size 75 cts or 4 of each for \$5.

Second size (good thrifty trees) 50 cts or 6 of each for \$5.

If you wish to plant these trees get in your order at once, for the stock is limited and they can be had nowhere else for I am the originator and have the entire stock.

I also have a few Elberta trees which I will sell for 25 & 15 cts each.

I will be pleased to serve you to my best ability.

Dr. C. S. Webster White City,
Kansas.
